

Case Study:

SecurityPlan approached Jana to create a mobile security application that worked from everyday mobile Phones.

Objective: SecurityPlan had a home security solution that employed the use of Wi Fi cameras for real-time web monitoring of homes. SecurityPlan wanted to enhance this with real time monitoring from mobile phones.

Jana Technology Services provide outsourced sales, consultancy and marketing services for Technology companies in the UK.

We have particular expertise in helping companies outside of the UK and Europe to penetrate the region.

Strategy: Jana designed a J2ME MIDP 2 application that allowed for real time monitoring of SecurityPlan's home security solution using ordinary mobile phones. Access to each camera feed was protected by an encrypted password for each user.

Results: SecurityPlan gained an add-on product to their home security portfolio, and plans are already being made to enhance the solution to provide real-time movement monitor based alerts to home users by SMS.

The product was brought in on time and to budget.
